

# Class 9: Halloween Mini-Project

Sarah Mirsaidi Madjdabadi, A16890186

## Table of contents

1. Importing candy data . . . . .	1
2. What is your favorite candy? . . . . .	2
Exploratory Analysis . . . . .	3
Overall Candy Rankings . . . . .	5
4. Taking a look at pricepercent . . . . .	11
5. Correlation Structure . . . . .	13
6. Principal Component Analysis (PCA) . . . . .	15

## 1. Importing candy data

```
candy <- read.csv("candy-data.txt", row.names=1)
head(candy)
```

	chocolate	fruity	caramel	peanutyalmondy	nougat	crispedricewafer
100 Grand	1	0	1	0	0	1
3 Musketeers	1	0	0	0	1	0
One dime	0	0	0	0	0	0
One quarter	0	0	0	0	0	0
Air Heads	0	1	0	0	0	0
Almond Joy	1	0	0	1	0	0

	hard	bar	pluribus	sugarpercent	pricepercent	winpercent
100 Grand	0	1	0	0.732	0.860	66.97173
3 Musketeers	0	1	0	0.604	0.511	67.60294
One dime	0	0	0	0.011	0.116	32.26109
One quarter	0	0	0	0.011	0.511	46.11650
Air Heads	0	0	0	0.906	0.511	52.34146
Almond Joy	0	1	0	0.465	0.767	50.34755

Q1. How many different candy types are in this dataset?

```
nrow(candy)
```

```
[1] 85
```

There are 85 different candy types in this data set.

Q2. How many fruity candy types are in the dataset?

```
table(candy$fruity)
```

```
0  1  
47 38
```

There are 38 fruity candy types in the dataset.

## 2. What is your favorite candy?

Q3. What is your favorite candy in the dataset and what is its winpercent value?

```
candy["Twix", ]$winpercent
```

```
[1] 81.64291
```

Q4. What is the winpercent value for “Kit Kat”?

```
candy["Kit Kat", ]$winpercent
```

```
[1] 76.7686
```

Q5. What is the winpercent value for “Tootsie Roll Snack Bars”?

```
candy["Tootsie Roll Snack Bars", ]$winpercent
```

```
[1] 49.6535
```

## Exploratory Analysis

We can use the **skimr** package to get a quick overview of a given dataset. This can be useful for the first time you encounter a new dataset.

```
skimr::skim(candy)
```

Table 1: Data summary

Name	candy
Number of rows	85
Number of columns	12
Column type frequency:	
numeric	12
Group variables	
None	

### Variable type: numeric

skim_variable	n_missing	complete_rate	mean	sd	p0	p25	p50	p75	p100	hist
chocolate	0	1	0.44	0.50	0.00	0.00	0.00	1.00	1.00	
fruity	0	1	0.45	0.50	0.00	0.00	0.00	1.00	1.00	
caramel	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
peanutyalmondy	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
nougat	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
crispedricewafer	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
hard	0	1	0.18	0.38	0.00	0.00	0.00	0.00	1.00	
bar	0	1	0.25	0.43	0.00	0.00	0.00	0.00	1.00	
pluribus	0	1	0.52	0.50	0.00	0.00	1.00	1.00	1.00	
sugarpercent	0	1	0.48	0.28	0.01	0.22	0.47	0.73	0.99	
pricepercent	0	1	0.47	0.29	0.01	0.26	0.47	0.65	0.98	
winpercent	0	1	50.32	14.71	22.45	39.14	47.83	59.86	84.18	

Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset?

Yes, the `candy$winpercent` column is on a 0-100 scale while all the others are on a 0-1 scale.

Q7. What do you think a zero and one represent for the `candy$chocolate` column?

0 = the candy is not chocolate; 1 = the candy is chocolate.

Q8. Plot a histogram of winpercent values

```
hist(candy$winpercent)
```

Q9. Is the distribution of winpercent values symmetrical?

No, the distribution is skewed to the left.

Q10. Is the center of the distribution above or below 50%?

```
summary(candy$winpercent)
```

Min.	1st Qu.	Median	Mean	3rd Qu.	Max.
22.45	39.14	47.83	50.32	59.86	84.18

The median is below 50%, but the mean (susceptible to outliers) is around 50%.

Q11. On average is chocolate candy higher or lower ranked than fruit candy?

```
choc.inds <- candy$chocolate == 1  
choc.candy <- candy[choc.inds, ]  
choc.win <- choc.candy$winpercent  
mean(choc.win)
```

```
[1] 60.92153
```

```
fruity.inds <- candy$fruity == 1
fruity.candy <- candy[fruity.inds, ]
fruity.win <- fruity.candy$winpercent
mean(fruity.win)
```

```
[1] 44.11974
```

On average, the chocolate candy is ranked higher than the fruity candy.

Q12. Is this difference statistically significant?

```
ans <- t.test(choc.win, fruity.win)
ans
```

Welch Two Sample t-test

```
data:  choc.win and fruity.win
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 11.44563 22.15795
sample estimates:
mean of x mean of y
 60.92153  44.11974
```

```
ans$p.value
```

```
[1] 2.871378e-08
```

Yes, with a p-value of  $2.871378 \times 10^{-8}$  ( $<0.05$ ).

## Overall Candy Rankings

Q13. What are the five least liked candy types in this set?

There are two related functions that can help here. One is the classic `sort()` and the other is `order()`.

```
x <- c(5, 10, 1, 4)
sort(x)
```

```
[1] 1 4 5 10
```

```
order(x)
```

```
[1] 3 4 1 2
```

```
inds <- order (candy$winpercent)
head(candy[inds,], 5)
```

	chocolate	fruity	caramel	peanut	almond	nougat
Nik L Nip	0	1	0		0	0
Boston Baked Beans	0	0	0		1	0
Chiclets	0	1	0		0	0
Super Bubble	0	1	0		0	0
Jawbusters	0	1	0		0	0

	crisped	rice	wafer	hard	bar	pluribus	sugar	percent	price	percent
Nik L Nip		0	0	0		1		0.197		0.976
Boston Baked Beans		0	0	0		1		0.313		0.511
Chiclets		0	0	0		1		0.046		0.325
Super Bubble		0	0	0		0		0.162		0.116
Jawbusters		0	1	0		1		0.093		0.511

	winpercent
Nik L Nip	22.44534
Boston Baked Beans	23.41782
Chiclets	24.52499
Super Bubble	27.30386
Jawbusters	28.12744

Q14. What are the top 5 all time favorite candy types out of this set?

```
tail(candy[inds,], 5)
```

	chocolate	fruity	caramel	peanut	almond	nougat
Snickers	1	0	1		1	1
Kit Kat	1	0	0		0	0
Twix	1	0	1		0	0
Reese's Miniatures	1	0	0		1	0

Reese's Peanut Butter cup	1	0	0	1	0
	crispedrice	wafer	hard bar	pluribus	sugarpercent
Snickers		0	0	1	0.546
Kit Kat		1	0	1	0.313
Twix		1	0	1	0.546
Reese's Miniatures		0	0	0	0.034
Reese's Peanut Butter cup		0	0	0	0.720
	pricepercent	winpercent			
Snickers	0.651	76.67378			
Kit Kat	0.511	76.76860			
Twix	0.906	81.64291			
Reese's Miniatures	0.279	81.86626			
Reese's Peanut Butter cup	0.651	84.18029			

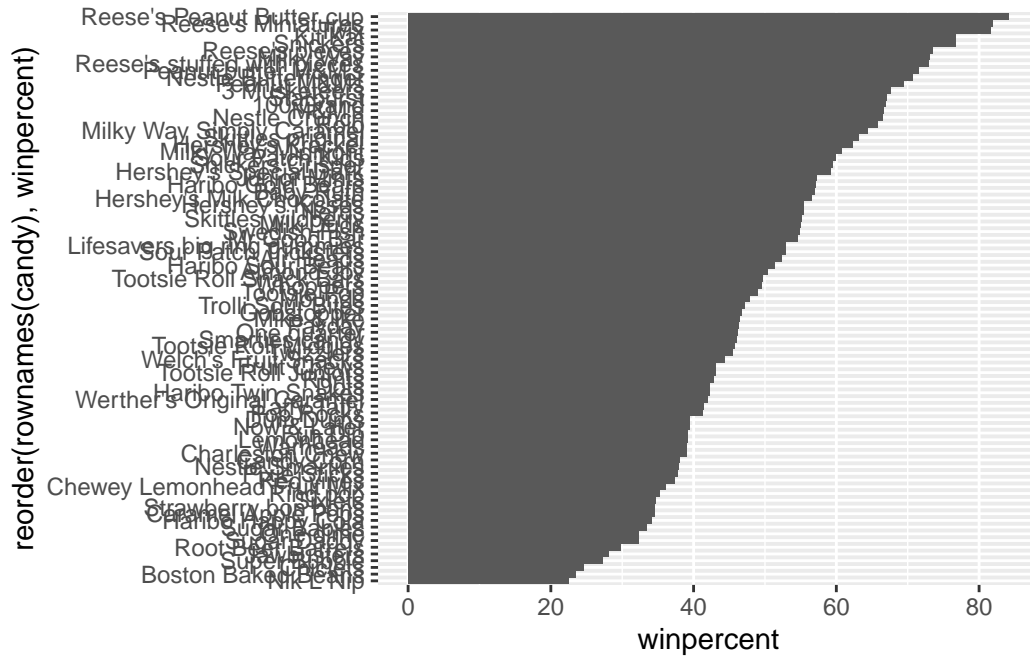

Q15. Make a first barplot of candy ranking based on winpercent values.

```
library(ggplot2)
ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```

Q16. This is quite ugly, use the `reorder()` function to get the bars sorted by winpercent?

```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col()
```

Custom Color Vector:

```
my_cols=rep("black", nrow(candy))
my_cols[as.logical(candy$chocolate)] = "chocolate"
my_cols[as.logical(candy$bar)] = "brown"
my_cols[as.logical(candy$fruity)] = "pink"
```

```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col(fill=my_cols)
```

```
ggsave("mybarplot.png", width=3, height=8)
```

Figure 1: My silly barplot image

Q17. What is the worst ranked chocolate candy?

Sixlets.

Q18. What is the best ranked fruity candy?

Starburst.

#### 4. Taking a look at pricepercent

```
library(ggrepel)

# Pink is too light, let's change to red
my_cols[as.logical(candy$fruity)] = "red"

# How about a plot of price vs win
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=my_cols) +
  geom_text_repel(col=my_cols, size=3.3, max.overlaps = 8)
```

Warning: ggrepel: 52 unlabeled data points (too many overlaps). Consider increasing max.overlaps

```
ord <- order(candy$pricepercent, decreasing = TRUE)
head( candy[ord,c(11,12)], n=5 )
```

	pricepercent	winpercent
Nik L Nip	0.976	22.44534
Nestle Smarties	0.976	37.88719
Ring pop	0.965	35.29076
Hershey's Krackel	0.918	62.28448
Hershey's Milk Chocolate	0.918	56.49050

Q19. Which candy type is the highest ranked in terms of winpercent for the least money - i.e. offers the most bang for your buck?

Reese's Miniatures.

Q20. What are the top 5 most expensive candy types in the dataset and of these which is the least popular?

Nik L Nip.

## 5. Correlation Structure

```
cij <- cor(candy)
cij
```

	chocolate	fruity	caramel	peanutyalmondy	nougat
chocolate	1.0000000	-0.74172106	0.24987535	0.37782357	0.25489183
fruity	-0.7417211	1.00000000	-0.33548538	-0.39928014	-0.26936712

crispedricewafer	0.06994969	0.3282654	0.3246797		
hard	0.09180975	-0.2443653	-0.3103816		
bar	0.09998516	0.5184065	0.4299293		
pluribus	0.04552282	-0.2207936	-0.2474479		

sugarpercent	1.00000000	0.3297064	0.2291507
pricepercent	0.32970639	1.0000000	0.3453254
winpercent	0.22915066	0.3453254	1.0000000

```
library(corrplot)
```

```
corrplot 0.95 loaded
```

```
corrplot(cij)
```

Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)?

Fruit and chocolate.

```
round( cij["chocolate", "fruity"], 2)
```

```
[1] -0.74
```

Q23. Similarly, what two variables are most positively correlated?

Chocolate and winpercent.

```
round( cij["chocolate", "winpercent"], 2)
```

```
[1] 0.64
```

## 6. Principal Component Analysis (PCA)

We need to be sure to scale our input `candy` data before PCA as we have the `winpercent` column on a different scale to all others in the dataset.

```
pca <- prcomp(candy, scale=T)
summary(pca)
```

Importance of components:

	PC1	PC2	PC3	PC4	PC5	PC6	PC7
Standard deviation	2.0788	1.1378	1.1092	1.07533	0.9518	0.81923	0.81530
Proportion of Variance	0.3601	0.1079	0.1025	0.09636	0.0755	0.05593	0.05539
Cumulative Proportion	0.3601	0.4680	0.5705	0.66688	0.7424	0.79830	0.85369

	PC8	PC9	PC10	PC11	PC12
Standard deviation	0.74530	0.67824	0.62349	0.43974	0.39760
Proportion of Variance	0.04629	0.03833	0.03239	0.01611	0.01317
Cumulative Proportion	0.89998	0.93832	0.97071	0.98683	1.00000

First main result figure is my “PCA plot”

```
ggplot(pca$x) +
  aes(PC1, PC2, label=rownames(pca$x)) +
  geom_point(col=my_cols) +
  geom_text_repel(max.overlaps = 6, col=my_cols) +
  theme_bw() +
  labs(title="Halloween Candy PCA Space",
       subtitle="Colored by type: chocolate bar (dark brown), chocolate other (light brown),
       caption="Data from 538")
```

Warning: ggrepel: 71 unlabeled data points (too many overlaps). Consider increasing max.overlaps

## Halloween Candy PCA Space

Colored by type: chocolate bar (dark brown), chocolate other (light brown),

Data from 538

The second main PCA result is in the `pca$rotation` we can plot this to generate a so-called “loadings” plot.

```
ggplot(pca$rotation) +  
  aes(PC1, reorder(rownames(pca$rotation), PC1), fill=PC1) +  
  geom_col()
```

Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you?

Fruity, hard, and pluribus. Yes, these make sense because they are correlated with each other (and not correlated with the other types of candy).
